Visit NoVirusThanks SiteQ: Best way to keep file paths up to date when working with the latest version of Scala IDE? I've been using Scala IDE 1.0 for a while and wanted to switch over to the latest version but got a bit annoyed that when working with the latest version I can't access the Scala Console from the main menu. There's just no button. What's the best way to handle this? I suspect that I should not just download the new version and let it overwrite Scala IDE 1.0 but instead somehow setup the directories and stuff myself so that I can access the Scala Console again? It's really annoying that all the tutorials I've found on the internet always seems to assume that you use version 1.0. A: In Scala IDE 2.0 when I'm editing a Scala file, I press ALT-ENTER to access the Scala console, and it works. Of course that is dependent on the OS I'm using. As far as I know, the way to start Scala IDE 2.0 is to go to your home directory, make a directory called Scala and make sure you're in it, then run \$ scala -version to test it out. Once you've found the right version, run \$ export PATH=\$PATH:\$HOME/Scala/sbt/bin/, which tells the shell to add Scala's bin directory to your \$PATH variable. Then \$ scala -version should work. The \$PATH and \$PATH+\$HOME variables are the way to keep your scala bin directory in your path. This should be well documented in the read me or install instructions, but here's a link: A: I always use the ant commands to update the Scala IDE. I do it in a bash script that I name "scala_update.sh", and I simply run it. It looks something like this:

There is also a download for the source code (I don't know how to use that and I don't really want to mess with it). Q: Can't open SQLite browser to edit table SQLite browser 3.7.9 is not allowing me to edit any of the tables in my database. I started getting this error after updating to 3.7.9 from 3.7.2. Here is a video example of how I can open the SQLite browser in version 3.7.2, but can't do so in 3.7.9. A: I finally found the solution. I'm posting this as an answer, since I had linked to the video, but don't want the comment to be deleted. I fixed the issue by updating the Google API that was previously being called by selft.opener. Seems like this update changed the way the API was being called, so the opener argument was not required. This is an updated version of the code that was originally posted in a comment. def selft(self): if self.db: db = SQLiteDatabase.connect(self.path) print 'opening sqlite database' return db else: return self.opener() def selft_switched_to_open(self): self.selft = self.open() def open(self):
