Функции Spread for ASP.NET Spread for ASP.NET includes several charting components, as well as multiple data visualization components. The following

---

table lists the charting components included in Spread for ASP.NET: Chart : The chart is the core component of any spreadsheet. When you plot points on a graph, they are represented as a series of x and y coordinates. To create a simple chart, select the chart component and click on the "Add Series" button. For example, to plot a series of five points on a graph, click on the "Add Series" button. Excel offers many different charting options, such as column charts, stacked charts, horizontal bar charts, vertical bar charts, trend charts, etc. Area Chart : A simple yet efficient tool to graph data. The area chart displays the data with two or more values of the same type in a straight line on the chart. The line is drawn by calculating the average of all values with the same x coordinate. This type of chart is useful when you want to graph data with the same values in a simple and compact way. Bar Chart : The bar chart is used to plot data in a vertical (column) or horizontal (row) format. Click on the "Add Series" button to add a series of points on a graph. This component displays the data on the Y-axis and the various points on the x-axis. To add a second series of data, double-click on the bar chart. You can choose a color for the bars, add a border,
